Loadsmart Sales Motion Workflow

As of November 2026.
Patrick Diamitani

Overview

Hybrid - Automation/Manual

Automated Track

- **Claude ICP Selection:** Claude nominates 20 accounts per AE/SDR pod based on a cross-analysis of closed-won opportunities and target industries with high customer count and spend.
- **Salesforce Flagging:** These selected accounts are marked in the CRM using a custom field where "ABM Account" = "True".
- **Contact Population:** ZoomInfo and Claude automatically pull and sync contact data into Salesforce for the selected accounts so the pods do not have to pull contacts themselves.
- **Email Creation & Outreach:** Claude generates the email copy. Claude then pushes these emails directly to Gong via API for automated sending per rep/prospect.

Manual Track

- **Account Vetting:** The AE/SDR pod retains their 20 assigned accounts but holds the authority to manually disqualify an account if they choose to.
- **Multi-Threading Execution:** The AEs and SDRs are strictly responsible for executing manual phone calls and LinkedIn messaging

Analysis

Diagnose. Where do you expect this program is leaking (at the signal stage, at the icp/buyer persona identity and rationalization, and how would you find out? Tell us what you'd check, what a red flag looks like, and how you'd tell a symptom from a root cause.

1. ICP/Signal Clarification

Well first we don't know where Claude generates this pipeline ICP/signal. Is it from the internal CRM database? Or searching for companies based on the data dump and how is it quantifying "like" companies? What is it's prompt? "Find companies that are like company a?"

We also don't have a set ICP. We know it's "what's working" but helping to define it once can also help Claude search amongst what's working and what's ideal.

From the ICP we don't know what the User persona setup is. So I'd start with again, documenting the User persona and the ICP so there's a document source.

2. Process Standardization

Speaking of document sources, if everything is running through claude, we should standardize this process and create chron jobs, so this isn't happening sporadically. So, Have the 20 accounts be set to send out it's requests for contacts to zoominfo daily at the right time. Or same time. And so there's one fluid process.:

1. Daily signal
2. Company Account
3. Contact Enrichment for each buyer persona for each product
4. Account/Buyer research for each prospect
5. Claude email generation based on that research
6. Sync to Gong for Outreach

This can be done as a set of individual Skills, with possibly a graph (set of skills run in an order) routine set up to run daily at xam. For example:

- Signal Skill (If needed), running daily at 6am - finds new weekly lead targets from ICP
- Account Tagging Skill - sends the weekly signal list import to reps by adding ABM tag
- Enrichment Skill - Look daily for tags that are set as ABM and find contacts from persona
- Research Skill - finds daily tags and conducts research on company/prospect/value prop
- Email skill - Once research tag is assigned and filled to prospect, write body only email
- Sequence Skill - use body only tag (ai email 1) to add to sequence (hi -, email 1 - bye)

This way each individual skill takes care of part of the process, but it's set up in order daily to run at the same time.

I would also add the call and linked in channels as part of the major Gong Sequences, so that daily the reps just follow their tasks to see which calls and linked in posts need to be made. Or even automate the linkedin posting all the way, with custom note generation for connections.

3. Lack of Reporting

This process you have currently doesn't address whether or not the reps are reporting activity, hitting metrics, or identify any kind of analysis. I'd simply add a skill to check daily the output from the last days sequence, or pull together daily outreach and sequence numbers into a dashboard in Salesforce that anyone can check or pull from by asking questions to the agent.
